

Pros	Cons
It will nutrient poor waters	It might turn into an ice age
It will make barren parts more productive	The effects won't last very long
It can sequester in the deep ocean one fourth to one third of the carbon dioxide in the air	The project will waste 3 million dollars a year
If we do something it can have a huge impact in the worlds pollution.	It can't be expected to have the exact same water by just pouring chemicals in the water

Conclusion:

In my opinion they should make this project happen since the amount of carbon dioxide in the air is too much to not do anything about it. It will make the phytoplankton much more stronger and that means it will make the air have less carbon dioxide. It will bring down the amount of CO2 in the air by a lot and it will make it cleaner to breath. People may think that it won't do anything but if we don't try we will never find out and miss a great opportunity to make the atmosphere cleaner.
